

## DEPTH OF FIELD

1. Shallow Focus: An object in the foreground is sharp and in focus, but the background is blurry or soft.
2. Deep Focus: The objects in the foreground and background are all in focus.
3. Racking Focus: An object in the foreground is in focus and the object in the background is blurry, but then we rack focus and the object in the foreground becomes blurry and the object in the background becomes sharp or clear (or vice versa).
